REALISTIC ROCK SHADER BREAKDOWN

The shader consists of 7 parts

Big Details
Micro Details
Moss
Snow
Unique Layer
Final Touches
Tile Textures Hub

BIG DETAILS

This layer is typically used for
large details on the rock, that will be visible from a far distance.

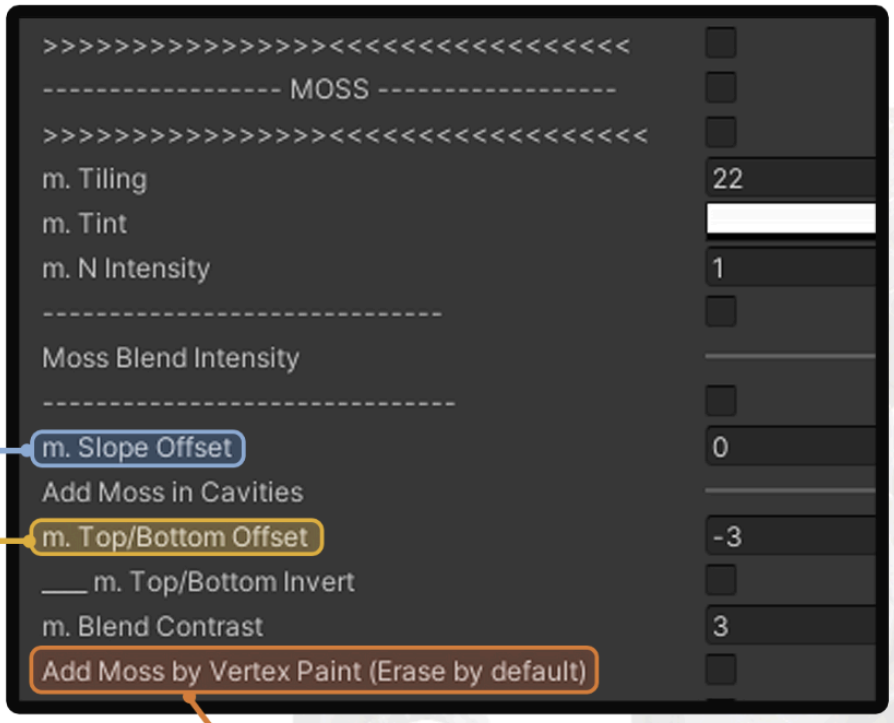

Breaks an obvious tiling of the N map using a noise map.

MICRO DETAILS

A layer for fine, micro details.

MOSS

Add moss on the horizontal surfaces.
The way the snow would lie.

Gradient placement of the moss from the top to bottom.

By default, if you paint white in the green channel, you will erase the moss.
Enable this property in order to add moss by painting.

This is a "naked" cliff
(without moss and snow)

Add Moss in Cavities

Moss. Slope Offset

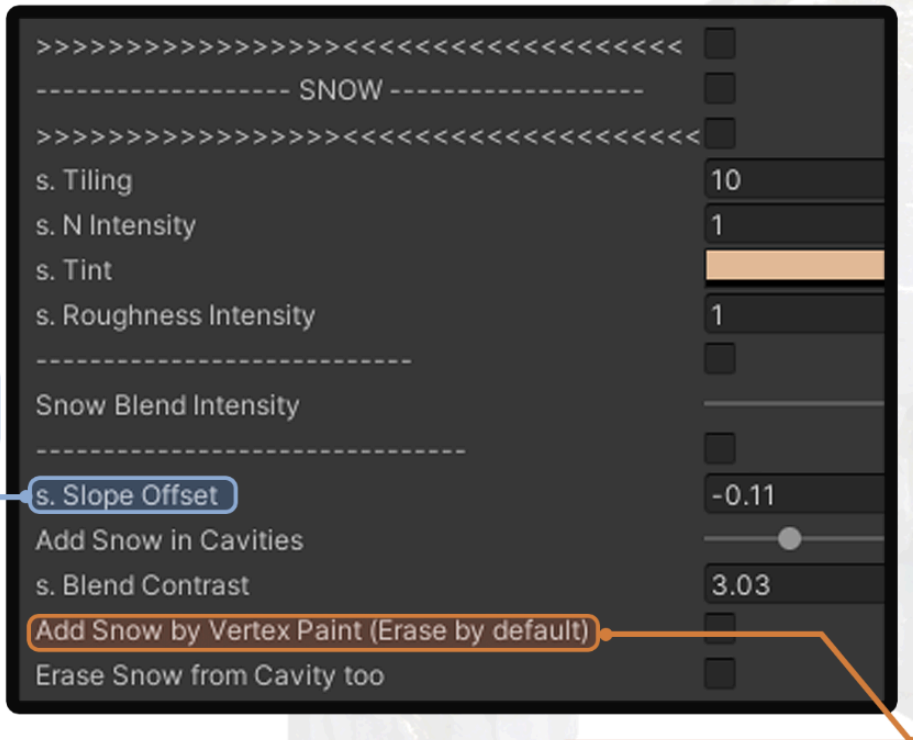

Moss. Top/Bottom Offset

Top/Bottom Invert

SNOW

Add snow on the horizontal surfaces.

Use the blue channel for painting/erasing the snow.

Snow. Slope Offset

Add Snow in Cavities

Add snow by VC painting

Erase snow by VC painting

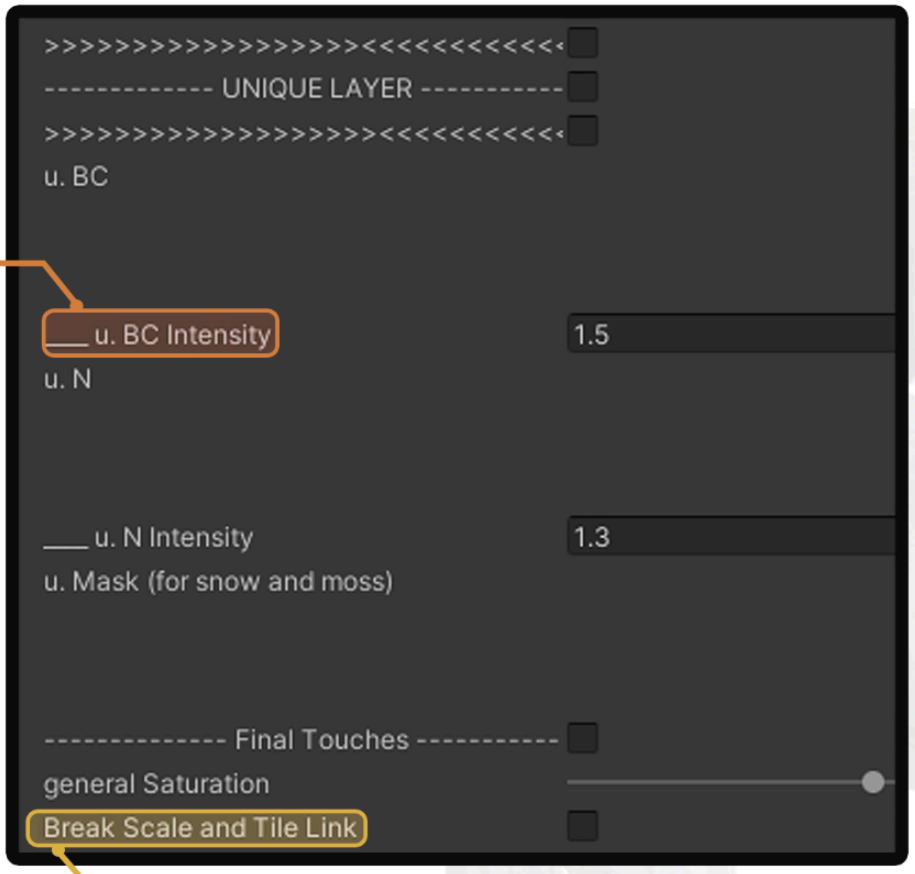

Erase Snow from Cavities too

UNIQUE LAYER and FINAL TOUCHES

There's not many things for you to change.
Increase or decrease the intensity of the textures and Saturation property for different rock look.

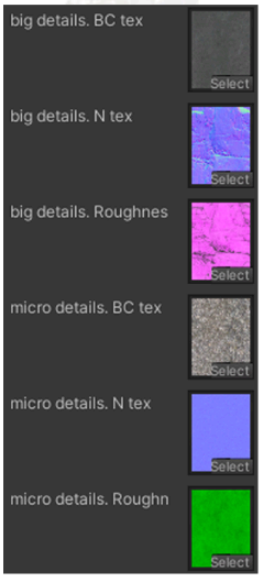

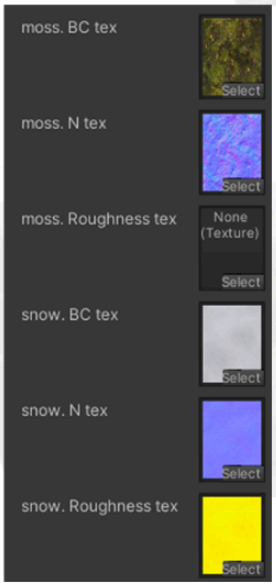

By default scling the rock increases the texture tiling value. Enable this option to break this link, a.k.a. a rock scaled by 2 and a rock scaled by 5 will have the same texture tiling.

TILE TEXTURES HUB

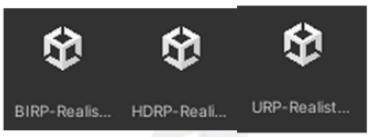

Part of the matertial where all the necessary and shared across all rock assets tile textures are assigned.

RENDER PIPELINE SETUP

By default, Built-In RP light and Post Processing are used.
If you use URP or HDRP, find a corresponding .unitypackage in the corresponding map folder (Overview or Sample map)

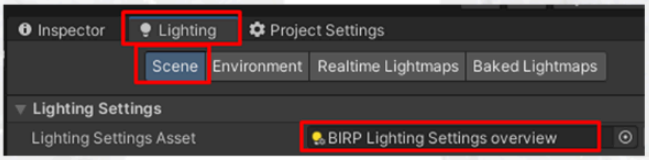

By importing the correspoding package,
Light, PPV and MainCamera
in the scene will be overwritten with the settings of the given render pipeline.

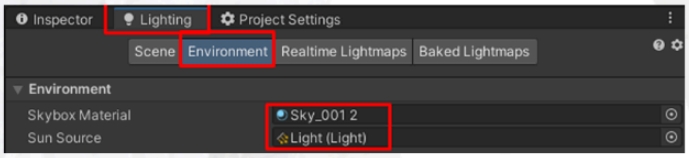

In rare cases the scene still may not look as intended, then proceed to a quick troubleshoot:

1. Save and re-open the scene again.

if it didn't work

1. Save and re-open the scene again.
2. Check the lighting settings, if the necessary asset is absent, added from the corresponding fodler (for example, Map_Overview -> "Built-in" fodler)

3. Save and re-open the scene again.

or

1. Remove the Light, PPV and MainCamera prefabs from the Hierarchy and add them again from the Asset Browser. They are located in the same folder with the RP subpackages./

"That's all Folks!"

Always try to refer to the online documentation, since it's the most up-to-date
